THREE-TRACK RUNWAY AND TAXIWAY PROFILES MEASURED
AT INTERNATIONAL AIRPORTS C AND D

By Albert W. Hall
Langley Research Center

SUMMARY

Three-track runway and taxiway profiles are presented for use in studies of airplane response to ground roughness. The profiles were obtained by measuring the elevation at 2-foot intervals along the center track and along tracks 15 feet on each side of the center. The elevations relative to an arbitrary datum were determined to the nearest 0.005 foot by conventional surveying methods. This report presents the tabulated and plotted profile data measured at two international airports (designated airports C and D).

INTRODUCTION

Modern computing techniques and equipment have greatly improved the capability of predicting airplane response to runway roughness if the roughness characteristics are known. The roughness characteristics can be defined basically by profiles determined from elevations measured at close intervals (usually 2 feet or less) along the length of the path to be defined. These profiles may be used directly or they may be transformed to power spectral density curves as the input data for computing airplane response.

In the past, runway profile data have been obtained by various organizations such as the National Advisory Committee for Aeronautics, the U.S. Air Force, aircraft manufacturers, and the NATO Advisory Group for Aeronautical Research and Development. Reference 1 presents a bibliography for these data. It is not possible to determine whether these profiles are representative of current commercial airports. Recently, the NASA has published some three-track profile data for runways located at two United States government installations. (See ref. 2.) However, there is very little three-track data available and there is practically no data representative of taxiway profiles.

In order to define better the ground environment for large commercial aircraft, the National Aeronautics and Space Administration has undertaken a program to measure a runway and a taxiway profile at each of 10 to 15 United States international airports. Data have been presented for the first two airports (designated airports A and B) in reference 3.

Data are presented in this report in both plotted and tabular form for two additional airports (designated airports C and D).

AIRPORTS

Plan views of the runways and taxiways measured at each airport are shown in figure 1. The pavements at airport C are of flexible construction and are supported by a sand filter course up to 2 feet thick. The runway was constructed with a number of different pavement cross sections having a total thickness of 48 to 35 inches. Most of the terminal area and taxiway pavements are 37 inches thick. The pavements at airport C are subject to severe freezing and thawing cycles.

The pavement construction at airport D is variable along the length of the runway and taxiway. The runway surface composition varies from 3-inch-thick asphaltic concrete to 16-inch-thick Portland cement concrete whereas the taxiway surface is composed of 3-inch-thick asphaltic concrete. The variation with horizontal distance of the pavement construction for airport D is given in the following table:

| Horizontal distance, ft | Surface | Base | Subbase |
|-------------------------|----------------------------------|----------------------------------|---|
| Runway 7L | | | |
| 0 to 1 640 | 3-inch asphaltic concrete | 12-inch crushed aggregate | 28-inch select material; 9-inch compacted soil |
| 1640 to 3 190 | 3-inch asphaltic concrete | 10-inch crushed aggregate | 12-inch select material; 9-inch compacted native soil |
| 3190 to 3 491 | 16-inch Portland cement concrete | 6-inch compacted soil | 12-inch compacted soil |
| 3491 to 4 513 | 3-inch asphaltic concrete | 10-inch emulsion stabilized base | 6-inch compacted native soil |
| 4513 to 4 613 | 12-inch Portland cement concrete | 4-inch crushed aggregate | 8-inch select material; 9-inch compacted native soil |
| 4613 to 6 970 | 10-inch Portland cement concrete | 3-inch asphaltic concrete | 9-inch compacted native soil |
| 6970 to 10 000 | 12-inch Portland cement concrete | 4-inch crushed aggregate | 8-inch select material; 9-inch compacted native soil |
| Taxiway F | | | |
| 0 to 1 630 | 3-inch asphaltic concrete | 12-inch crushed aggregate | 28-inch select material; 9-inch compacted soil |
| 1630 to 2 580 | 3-inch asphaltic concrete | 10-inch soil cement | 12-inch compacted native soil |
| 2580 to 4 985 | 3-inch asphaltic concrete | 8-inch emulsion stabilized base | 6-inch compacted native soil |
| 4985 to 6 970 | 3-inch asphaltic concrete | 10-inch crushed aggregate | 6-inch compacted native soil |
| 6970 to 8 000 | 3-inch asphaltic concrete | 12-inch crushed aggregate | 28-inch select material; 6-inch compacted native soil |

MEASUREMENTS

Three-track runway and taxiway profiles were obtained by measuring the elevation at 2-foot intervals along the center track and along tracks 15 feet on each side of the center. The profiles were measured by conventional surveying methods using rod, level, and tape. Vertical control was required within the first order of accuracy (maximum permissible error in feet, 0.017 times the square root of the distance in miles), and the individual elevations were determined to the nearest 0.005 foot. The elevations were taken relative to an arbitrary 50-foot datum. The horizontal layout was established by use of third-order chaining methods without a closing loop to the origin. The horizontal layout of elevation stations is shown in figure 2. When elevation readings were taken, the rod was only required to be within 3 inches of the true station location.

RUNWAY AND TAXIWAY PROFILES

The profiles were measured at airport C during June 1969 and at airport D during September 1969 and are shown in figure 3. At airport C, the three-track profiles were determined for a distance of 10 000 feet along runway 24 and for 9000 feet along taxiway A. At airport D, the three-track profiles were determined for a distance of 10 000 feet along runway 7L and for 8000 feet along taxiway F.

Figure 1 shows the location of the initial and final horizontal distance for each runway and taxiway profile that was measured and also the location of intersections with other runways and taxiways.

The profiles plotted in figures 3(a), 3(b), 3(c), and 3(d) are completely tabulated in tables I, II, III, and IV, respectively. These data can be made available on punched electric accounting machine cards or on 1/2-inch magnetic computer tape in card image format. These arrangements may be made by contacting the author at:
